

PT BLACKBOX

DYNAMIC APPLICATION SECURITY TESTING TOOL

Product overview

PT BlackBox simulates the actions of an attacker attempting to remotely compromise a site or service. The product not only detects third party components with known vulnerabilities, it also combines multiple analysis methods to find issues specific to the application under test. This makes PT BlackBox indispensable both as a standalone tool and as a dynamic analyzer integrated into your development pipeline.

Why PT BLACKBOX

Multidimensional vulnerability analysis

Analysis methods developed in close collaboration with leading cybersecurity experts allow detection of dozens of vulnerability classes (such as SQLi, RCE, XSS, XXE, and more).

Efficient scanning

Lowest resource consumption by skipping duplicate pages during scans, optimizing performance.

Flexible automated analysis

Scanning and authorization can be fine-tuned for a specific application, while the analysis is conducted automatically — eliminating the need for manual verification.

API vulnerability coverage

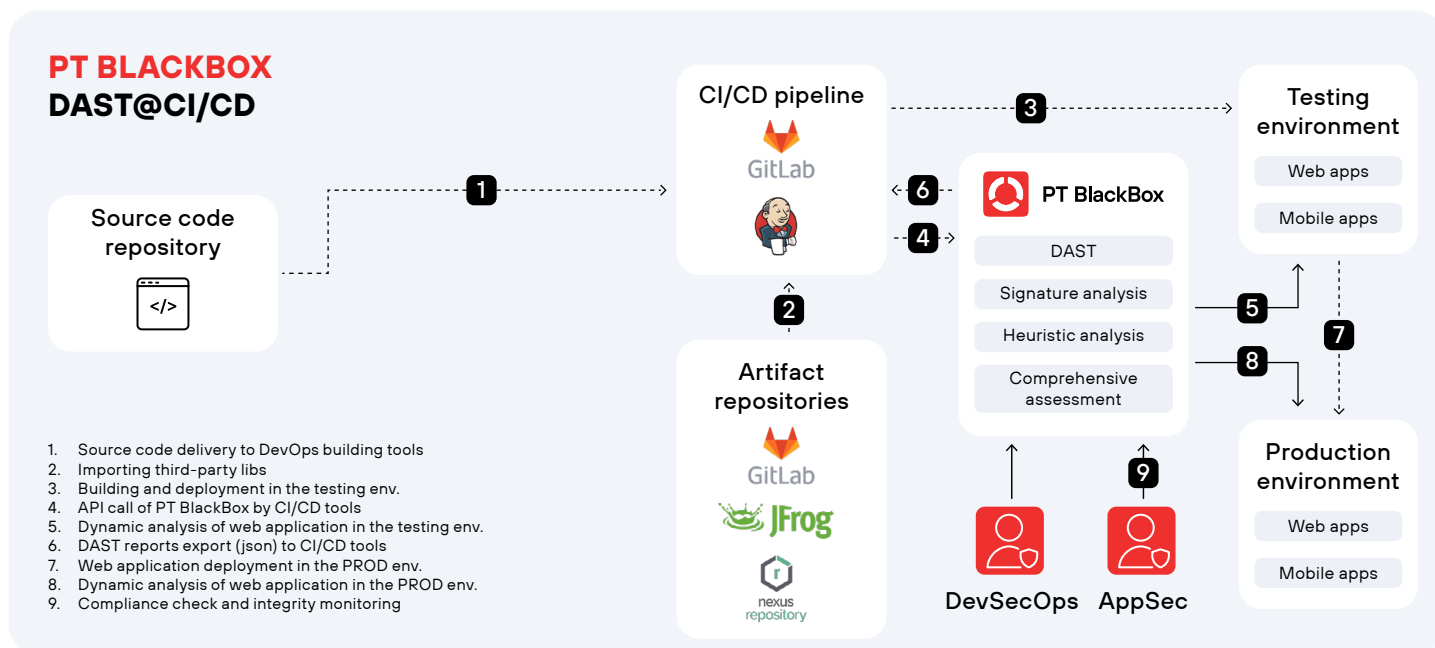

Direct API scanning enables you to identify potential vulnerabilities in critical backend systems.

Key statistics

98% of IT applications contain vulnerabilities

91% of applications allow hackers to steal sensitive data

84% of applications enable hackers to gain access to web resources

What you get

Effective detection of zero-day vulnerabilities

Thanks to a combination of signature and heuristic analysis, PT BlackBox can uncover previously unknown vulnerabilities.

DevSecOps compatible

PT Blackbox integrates natively into your organizations Secure Software Development Lifecycle (SSDLC) process for any automaton scenario.

PT BlackBox

LEARN MORE ABOUT

PT BLACKBOX

Positive Technologies provides result-driven cybersecurity solutions, safeguarding businesses, governments, and global events like the Olympic games, Phygital Games of the Future, and the FIFA World Cup from devastating attacks.
